# Coolwater Fry Culture in Ponds 

Chris Hartleb
Department of Biology
Northern Aquaculture Demonstration Facility Aquaponics Innovation Center

## Pond Dynamics

Source water quality

- Biological processes
- Plankton dynamics
- Photosynthesis
- Respiration
- Excretion
- Decomposition
- Nutrient cycling
- Benthos dynamics

## Pond

- Location \& shape
- Size \& depth
- Infrastructure
- Operation decisions
- Fish
- Species, size, density
- Inputs
- Fertilizers \& feed
- Energy (aerators)
- Water management
- Timing of operations

## Food Chain

## Natural and Artificial Spawn

University of Wisconsin-Stevens Point
College of Letters \& Science

## Fry Development

## Culture Practices

- Pond / Tank / Pond
- Step 1: Spawn Adults

Habituation

Growout

## Culture Practices

- Step 2: Place fry in outdoor culture pond

## Culture Practices

- Step 3: Larval fish feed on natural foods

## Culture Practices

- Step 4: Fertilizers added weekly to enhance aquatic food web

University of Wisconsin-Stevens Point

## Culture Practices

- Step 5: Harvest and feed-train: habituate to formulated feed

## Best Fertilizer

- Reduce costs
- Increase efficiency
- Increase survival rate
- Decrease the cost of fingerlings

## Inorganic Fertilizer

- Primary components:
- Nitrogen (N)
- Phosphorus (P)
- Carbon (C)
- Enhance autotrophic food webs

|  | Percentage |  |  |
| :--- | :---: | :---: | :---: |
| Fertilizer | $\mathbf{N}$ | $\mathbf{P}_{2} \mathbf{O}_{\mathbf{5}}$ | $\mathbf{K}_{\mathbf{2}} \mathbf{O}$ |
| Urea | 45 | 0 | 0 |
| Calcium nitrate | 15 | 0 | 0 |
| Sodium nitrate | 16 | 0 | 0 |
| Ammonium nitrate | $23-35$ | 0 | 0 |
| Ammonium sulfate | 0 | 0 | 0 |
| Superphosphate | 0 | $44-54$ | 0 |
| Triple superphosphate | 11 | 48 | 0 |
| Monoammonium phosphate | 11 | 0 |  |
| Diammonium phosphate | 18 | 48 | 0 |
| Calcium metaphosphate | 0 | $62-64$ | 0 |
| Potassium nitrate | 13 | 0 | 44 |
| Potassium sulfate | 0 | 0 | 50 |

## Organic Fertilizer

- Various types:
- Animal manures (poultry, cattle, etc)
- Plant material (hay, alfalfa, cottonseed, soybean meal, etc)
- Directly \& indirectly enhance algae \& zooplankton
- Direct: Input of N, P, C stimulate autotrophic food web
- Indirect: Stimulate heterotrophic food webs

|  | Average Composition (\%) |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Material | Moisture | N | $\mathrm{P}_{2} \mathrm{O}_{5}$ | $\mathrm{K}_{2} \mathrm{O}$ |
| Dairy cattle manure | 85 | 0.5 | 0.2 | 0.5 |
| Beef cattle manure | 85 | 0.7 | 0.5 | 0.5 |
| Poultry manure | 72 | 1.2 | 1.3 | 0.6 |
| Swine manure | 82 | 0.5 | 0.3 | 0.4 |
| Sheep manure | 77 | 1.4 | 0.5 | 1.2 |
| Mixed grass, dry | 11.0 | 1.12 | 0.48 | 1.44 |
| Fresh cut grass | 69.2 | 0.78 | 0.21 | 0.79 |
| Oat straw | 10.2 | 0.66 | 0.21 | 2.40 |
| Peanut hulls | 7.7 | 1.07 | 0.14 | 0.98 |
| Rice straw | 7.2 | 0.56 | 0.21 | 1.08 |
| Potato peelings | 79.8 | 0.34 | 0.09 | 0.0 |
| Sugar cane leaves | 74.3 | 0.21 | 0.16 | 0.91 |
| Cottonseed meal | 7.2 | 6.93 | 2.45 | 1.74 |
| Soybean meal | 9.7 | 7.31 | 1.44 | 2.30 |

## Nutrient Ratio Manipulation

- Nutrient composition of phytoplankton biomass

$$
-45-50 \% \text { C, } 8-10 \% \text { N, } 1 \% \text { P }
$$

- Low N:P ratios = cyanobacteria
- High N:P ratios = non-cyanobacteria algae
- 20:1 (N:P) [600 ug N/L and 30 ug P/L]
- Small green algae and diatoms = good
- Large filamentous and cyanobacteria = bad

## Green Water Method (Visibility)

- Implies green water is nutrient rich water
- Uses visibility/Secchi disk to determine greenness
- Inexpensive, subjective, minimal accuracy
- Does not consider composition of algae, plankton, or impact of fertilizer on oxygen
- Difficult to establish consistent food web

## Fixed Fertilization Rate Strategy

- Fertilizer is applied weekly at a selected quantity
- Requires prior knowledge of pond dynamics \& fish production
- Simple; annual production of fish predictable
- Can lead to over-fertilization and is specific for each pond

## Water Chemistry Measurement

- Regularly collected water samples are measured for:
- Total phosphorus \& soluble reactive phosphorus
- Ammonia-N, Nitrate-N, \& Nitrite-N
- Inorganic carbon
- Pond-specific \& can precisely measure nutrient deficiencies
- Significant cost, technical, time consuming, \& does not take into account daily fluctuations

## Algal Bioassay Fertilization Strategy

- Based on algal nutrition limitation of N, P, \& C
- Is pond \& time-specific; utilizes ponds own algal community
- Uses a simple visual indicator
- Inexpensive, simple, \& ecologically-based
- Water is collected weekly in clear sample bottles
- Each bottle is spiked with either N, P, C, or nothing (control), or a combination.
- Bottles are placed in sunlight for 2-3 days
- Water is filtered and compared visually and ranked as $100 \%$, 50\%, or 0\% rate-limiting

## Algal Bioassay Pond Samples

- Water samples showing nutrient spikes
- Filtered water showing limiting nutrient

## Yellow Perch Fry Example

- Methods
- Year 1: Examine pond fertilization practices
- Late April add organic fertilizer
- Late April to mid-June weekly inorganic fertilizer
- Urea-N and phosphoric acid (Desired Secchi depth 1.5 m)
- Monitor water chemistry of culture ponds
- Monitor phyto- and zooplankton
- Monitor growth of yellow perch fingerlings
- Stocked yellow perch fry (late April; 850,000 per $1 / 4$ acre)
- Evaluate diet

## Water Chemistry and Visibility

- $\mathrm{pH} 8.46 \pm 0.26$
- Alkalinity $156.5 \pm 13.2 \mathrm{ppm}$
- Hardness $248.2 \pm 26.7$ ppm

## Growth

Mean Length week 7

- Inorganic: $29.62 \mathrm{~mm} \pm 3.05$
- Organic: $25.13 \mathrm{~mm} \pm 2.79$
- T-test: p < 0.001

## Growth

Mean Weight week 7

- Inorganic: $0.316 \mathrm{~g} \pm 0.08$
- Organic: $0.192 \mathrm{~g} \pm 0.08$
- T-test: $\mathrm{p}<0.001$

## Results: Diet

Diet of yellow perch fry in the organic fertilized ponds

## Results: Diet

Diet of yellow perch fry in the inorganic fertilized ponds

## Results: Diet

Comparison of diets in inorganic and organic treatments
$\square$ Bosmina spp.
$\square$ Chydoridae
$\square$ Ceriodaphnia spp.
$\square$ Daphnia spp.
$\square$ Copepodite
$\square$ Nauplii
Simocephalus spp.

More food types in inorganic

Bosmina spp. vs. nauplii

Inorganic treated ponds, fish eat more

## Year 2: Four Fertilizer Treatments

## LM 2 <br> LM 3 <br> LM 4 <br> LM 10

## LM 2: Lake Mills Pond 2 received fixed-input organic fertilizer <br> LM 3: Lake Mills Pond 3 received variable inorganic fertilizer <br> LM 4: Lake Mills Pond 4 received fixed-input inorganic fertilizer <br> LM 10: Lake Mills Pond 10 received fixed-input organic plus variable inorganic fertilizer

## Zooplankton Attack

Chlorophyll concentration

- Highest but declines
- Fixed input inorganic
- Fixed input organic + variable inorganic
- Lowest but steady
- Variable inorganic
- Fixed input organic
- Why decline?
- Zooplankton predation

## LM 2 LM 3 LM 4 LM 10

LM 2: Lake Mills Pond 2 received fixed-input organic fertilizer
LM 3: Lake Mills Pond 3 received variable inorganic fertilizer
LM 4: Lake Mills Pond 4 received fixed-input inorganic fertilizer
LM 10: Lake Mills Pond 10 received fixed-input organic plus variable inorganic fertilizer

## Temperature Effect

|  | - LM 2 | - LM 3 | - LM 4 | - LM 10 |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 15 |  |  |  |  |  |
| © 14.5 |  |  |  |  |  |
| 迷 14 |  |  |  |  |  |
| 気 13.5 |  |  |  |  |  |
| $\frac{5}{E} 13$ |  |  |  |  |  |
|  |  |  |  |  |  |
| 11.5 |  |  |  |  |  |
| 0 | 0.0002 | 0.0004 | 0.0006 | 0.0008 | 0.001 |
|  |  | lorophyll a Ab | lance ( $\mathrm{Mg} / \mathrm{L}$ ) |  |  |

- Both inorganic fertilizer treated ponds showed highest yellow perch specific growth rate
- Both organic fertilized ponds showed lowest yellow perch specific growth rate

## - LM 2 LM 3 - LM 4 LM 10

LM 2: Lake Mills Pond 2 received fixed-input organic fertilizer
LM 3: Lake Mills Pond 3 received variable inorganic fertilizer
LM 4: Lake Mills Pond 4 received fixed-input inorganic fertilizer
LM 10: Lake Mills Pond 10 received fixed-input organic plus variable inorganic fertilizer

## Conclusions

- Application of fertilizer based on transparency to establish "green water" not a good indicator of pond fertilization or trophic cascade.
- Early fry growth was strongly temperature dependent as was fertilizer effectiveness.
- Implications of diet selection based on fertilization:
- Growth: Larger fish produced by inorganic treatment
- Larger amount of prey and more varied diet
- Bosmina spike in $5^{\text {th }}$ and $6^{\text {th }}$ weeks helpful for growth?
- Zooplankton bloom effect
- Possibility of gape limitation relaxation
- Poor survival related to low density of preferred prey.
